课程安排

- 生物背景和课程简介
- 传统生物统计学及其应用
- 生物统计学和生物大数据挖掘
 - Hidden Markov Model (HMM)及其应用
 - Markov Chain
 - HMM理论
 - HMM和基因识别 (Topic I)
 - HMM和序列比对 (Topic II)
 - 进化树的概率模型 (Topic III)
 - Motif finding中的概率模型 (Topic IV)
 - EM algorithm
 - Markov Chain Monte Carlo (MCMC)
 - 基因表达数据分析 (Topic V)
 - 聚类分析-Mixture model
 - Classification-Lasso Based variable selection
 - 基因网络推断 (Topic VI)
 - Bayesian网络
 - Gaussian Graphical Model
 - 基因网络分析 (Topic VII)
 - Network clustering
 - Network Motif
 - Markov random field (MRF)
 - Dimension reduction及其应用 (Topic VIII)
- 面向生物大数据挖掘的深度学习

研究对象：
生物序列，
进化树，
生物网络，
基因表达
...

方法：
生物计算与生物统计

第8-1章:蛋白质相互作用 的实验方法和预测

- Experimental methods
- Prediction of protein-protein interactions

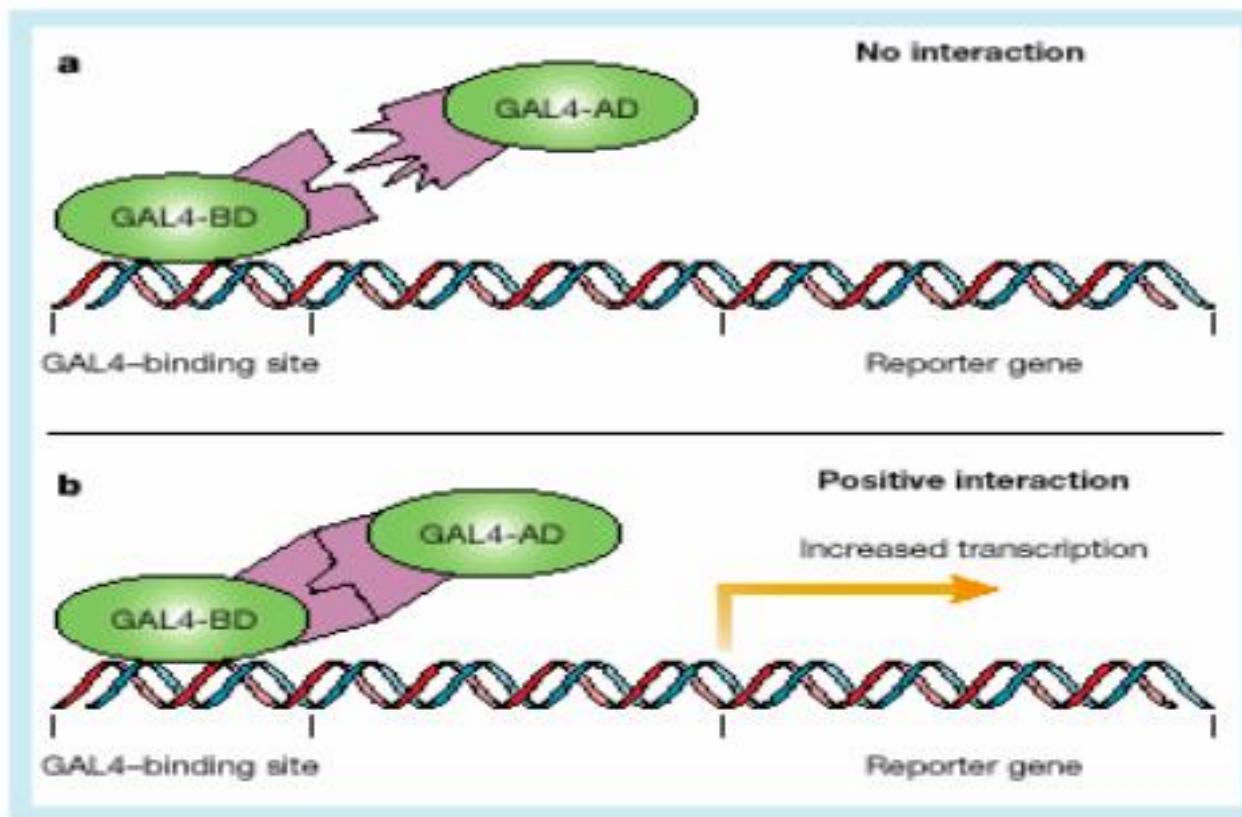

Part I: Experimental Methods

- Physical interaction
 - Yeast two hybrid system
 - TAP-mass spectrometry
- Genetic interaction
 - SGA
 - EMAP

Protein-protein interactions (Experimental methods)

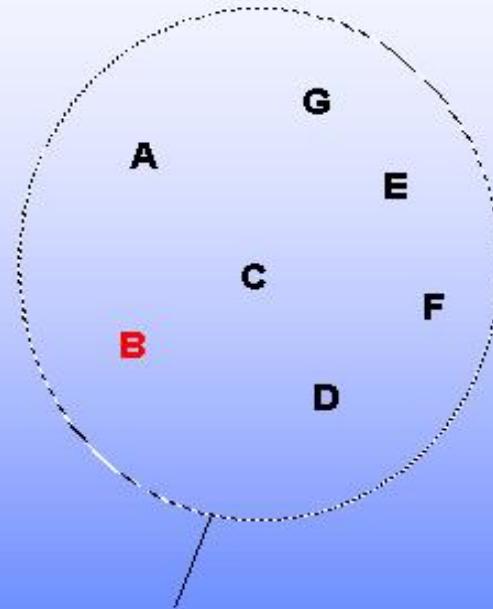

- Co-immunoprecipitation.
- Two-hybrid system (Uetz et al. 2000, Ito et al. 2000, 2001).
- Purified Complex by mass spectrometry
 - TAP: Tandem affinity purification (Gavin et al. 2002).
 - HMS-PCI: high-throughput mass spectrometric protein complex identification (Ho et al. 2002).

Mechanism of two-hybrid system

From: Nature 405, June 15, 2000, 837-846.

mass spec

**protein pulled down

Interaction Sequence Tags (ISTs)

From: Nature 405, June 15, 2000, 837-846.

Two data sets from yeast two hybrid system

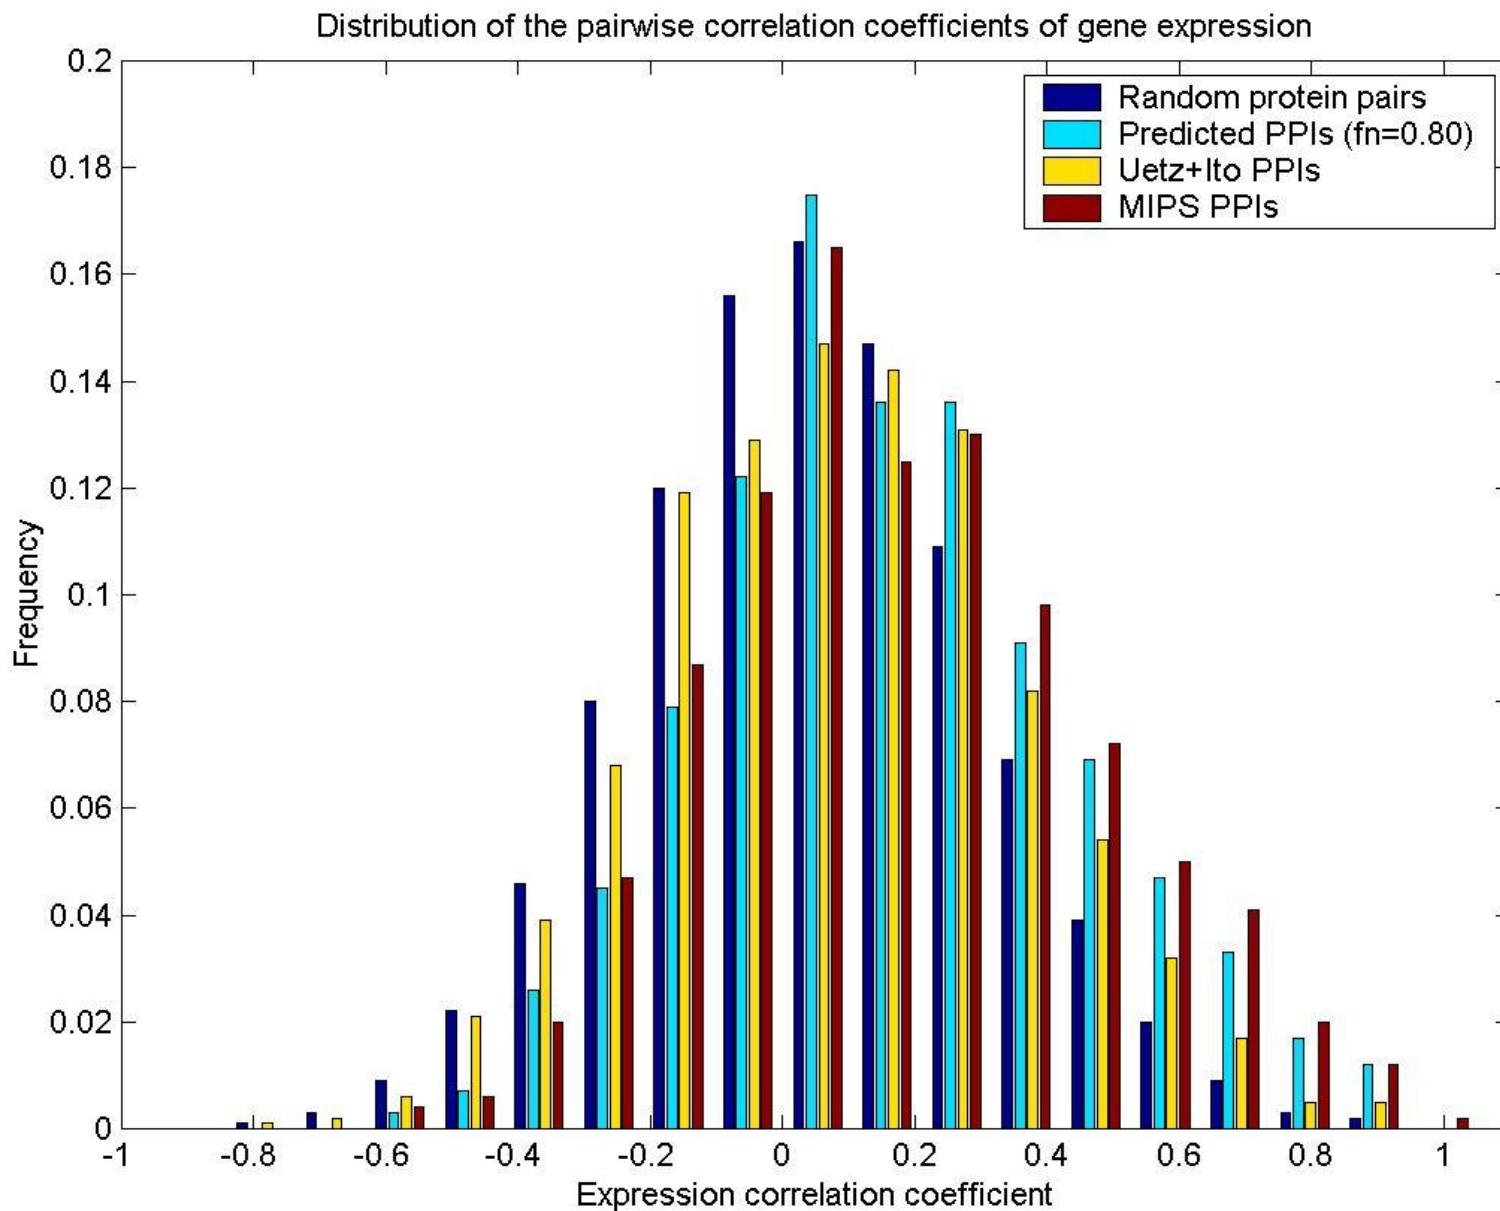

- Uetz's data (Uetz et al. 2000).
- Ito's data (Ito et al. 2000, 2001).

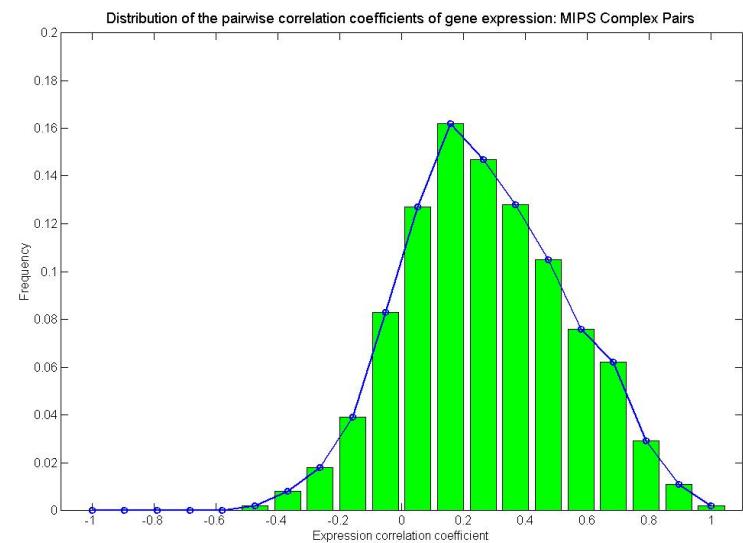

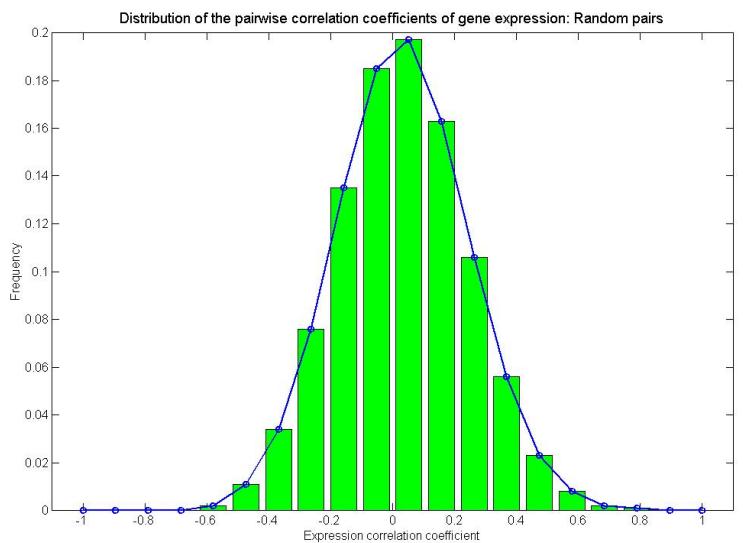

Possible Errors in 2-hybrid system

- False positive.
 - Possible mutation during PCR-amplifying.
 - Stochastic activation of reporter gene.
- False negative.
 - Membrane protein, post-translational modification protein, those self-activating reporter genes (Removed in experiment).
 - Weak interactions.

The size of interactome for yeast (5-50/protein)

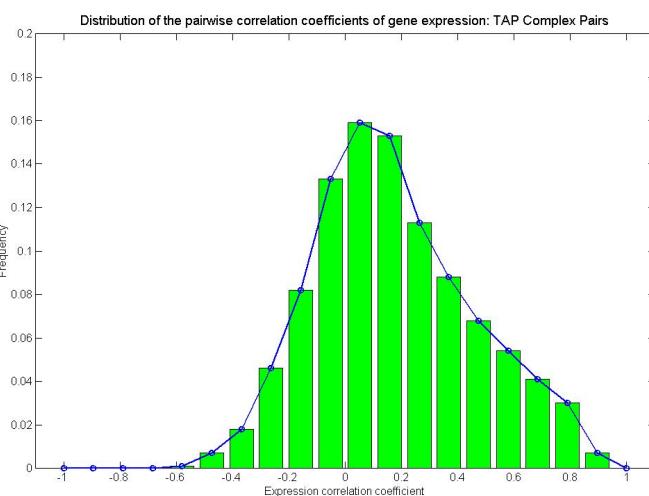

Non-interaction

$1 - \alpha$

Real interaction

α

Observed interaction data

MLE of the reliability

- Likelihood function

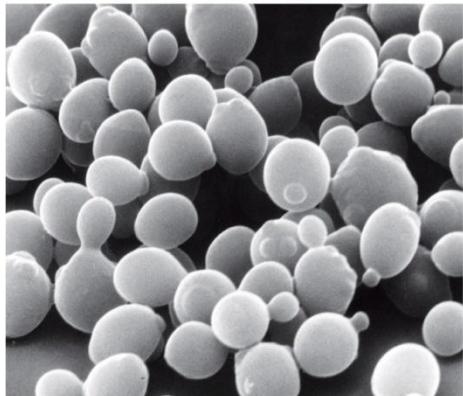

$$L(\alpha) = \prod_{k=1}^K (\alpha p_k + (1 - \alpha) q_k)^{n_k}$$

- Precision of the estimation

$$Var(\hat{\alpha}) = \frac{1}{\sum_{k=1}^K n_k \frac{(p_k - q_k)^2}{(\hat{\alpha} p_k + (1 - \hat{\alpha}) q_k)^2}}$$

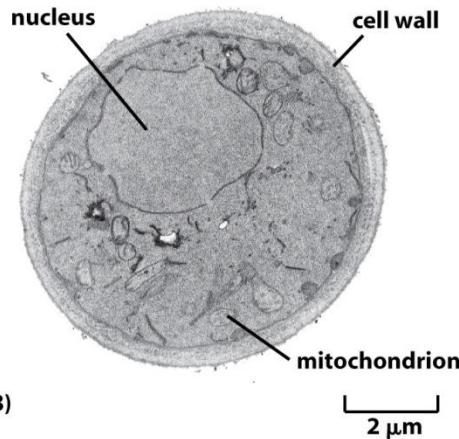

Budding Yeast

Saccharomyces Cerevisiae

(A)

10 μm

(B)

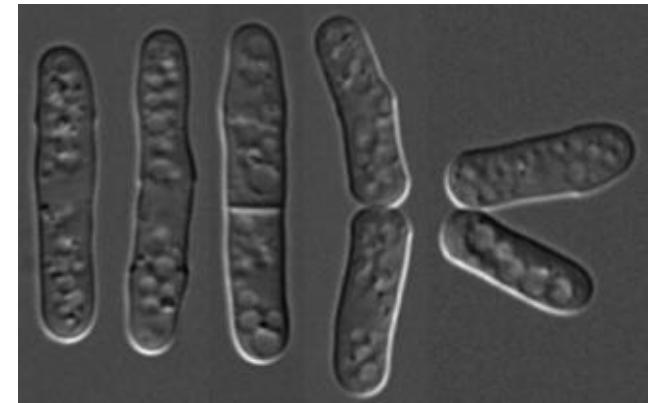

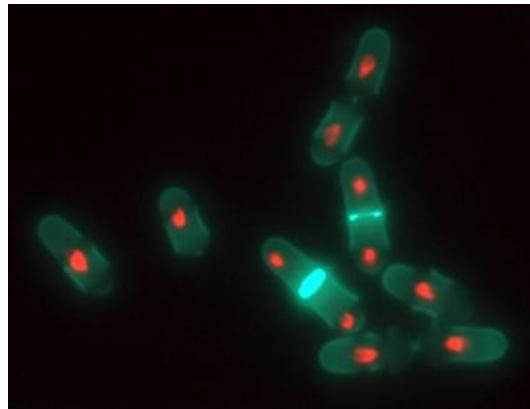

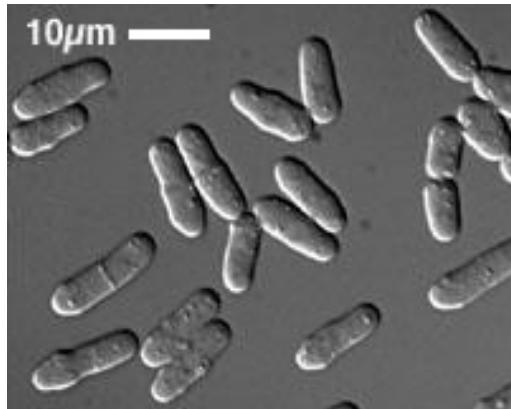

2 μm

- a and α mating type, cell cycle
- 6300 genes (1997)
- Genome-wide single mutants analysis (2000~)

Fission yeast

Schizosaccharomyces Pombe

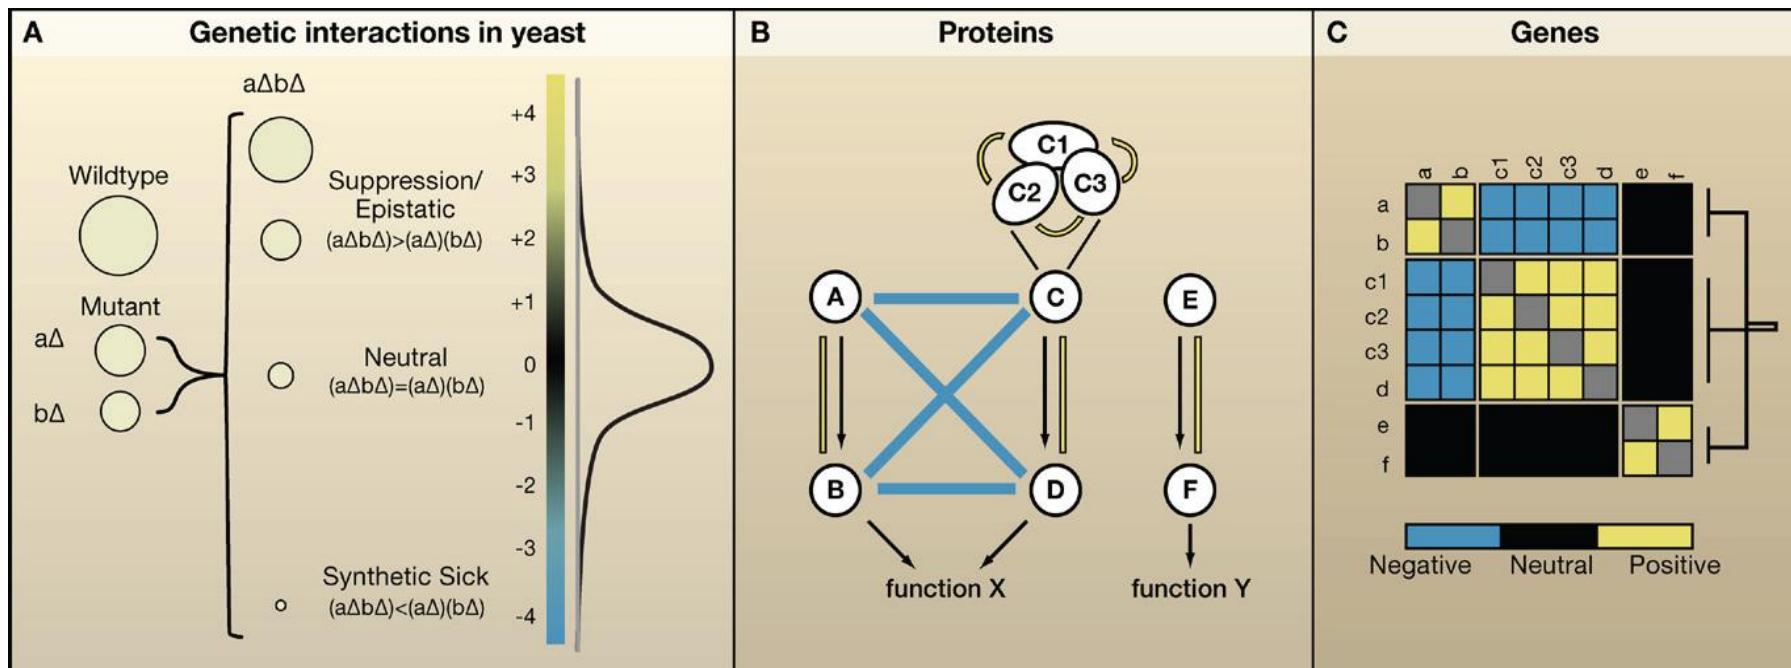

- 1000 million years separation from budding yeast;
- 13.8 Mb genome size, 4824 genes (open reading frames, OPF);
- 3 chromosomes, no genome-wide duplications; h+ and h- mating types;
- Cell cycle: 10% G1, 10% S, 70% G2 and 10% M phases.
- Genome-wide single mutants analysis (2010~)

more similar to metazoans than *S. cerevisiae*

- *cell cycle* regulation in G2/ M phase,
- gene regulation by the RNAi pathway
- the widespread presence of introns in genes

What's Genetic Interaction

- Genetic interactions between two loci can be mapped by measuring how the phenotype of an organism lacking both genes (double mutant) differs from that expected when the phenotypes of the single mutations are combined
- Null model: $F(\Delta AB) = F(\Delta A) * F(\Delta B)$

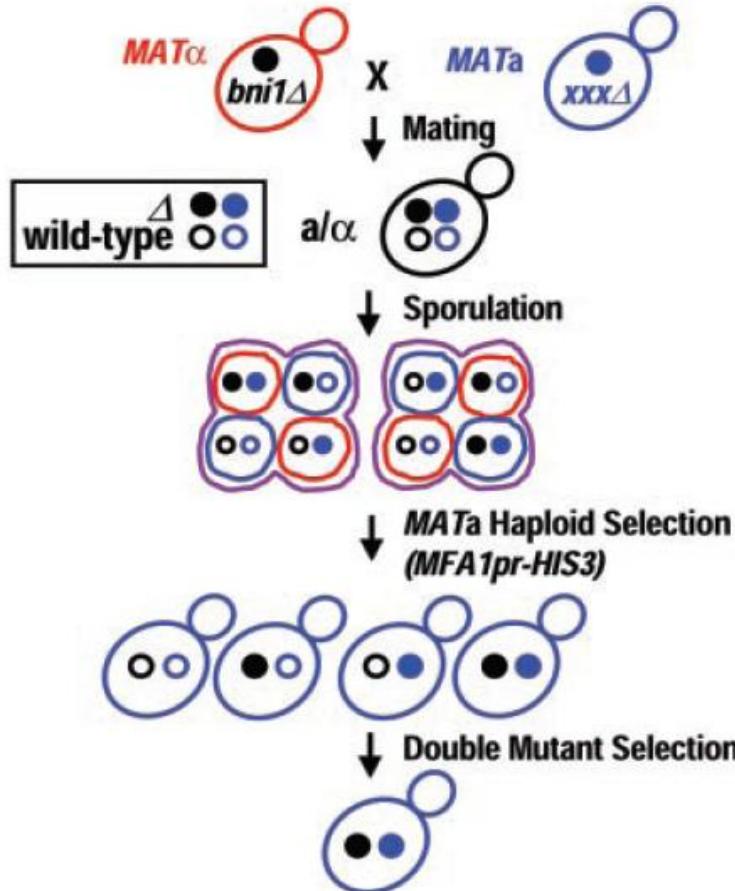

Identification of Genetic Interactions

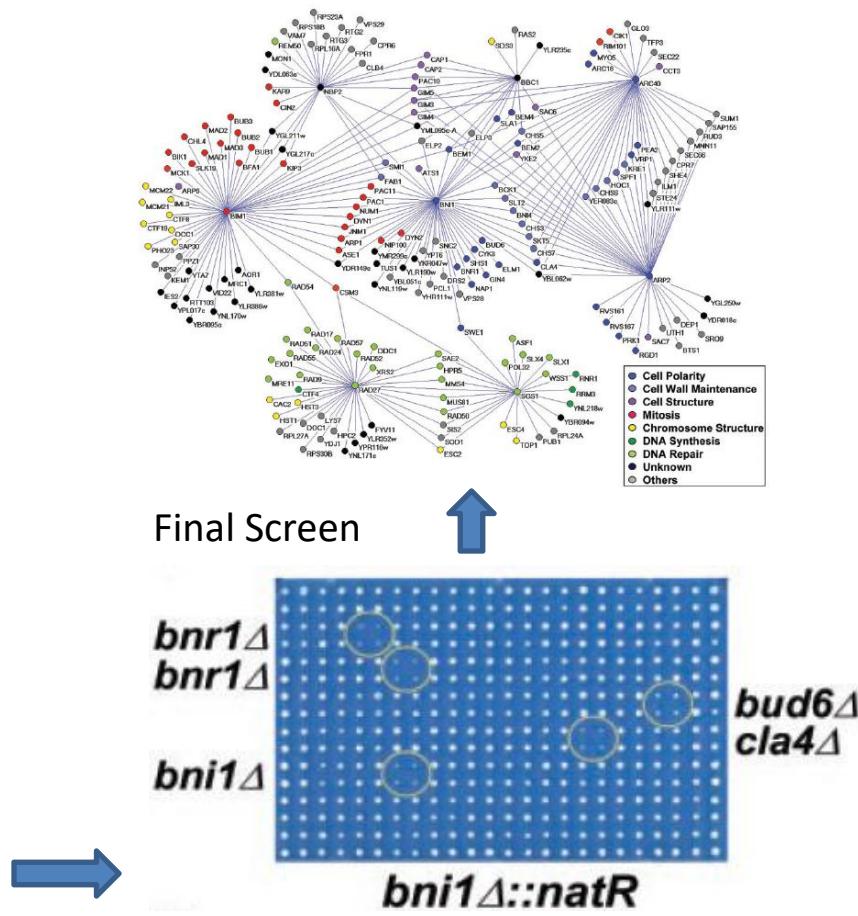

- Synthetic Gene Array (SGA) (Tong, et al. 2001)
- Diploid based Synthetic Lethality Analysis on Microarrays (dSLAM) (Pan, X., et al. 2004)

Synthetic Gene Array (SGA)

Synthetic genetic array methodology

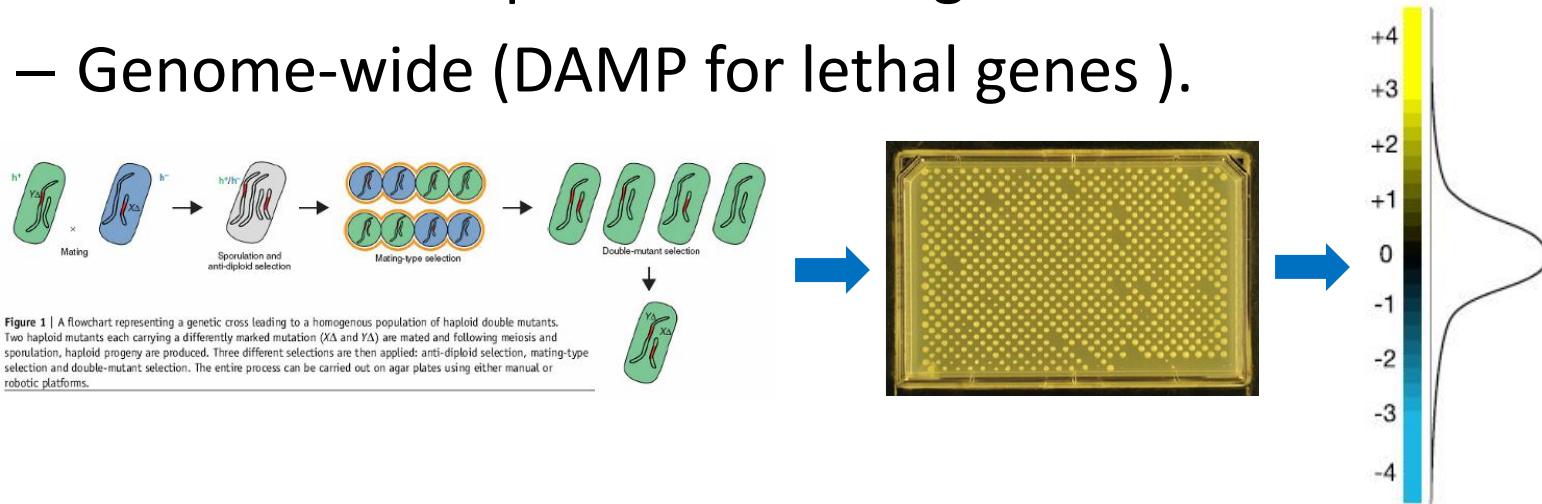

Genetic Interaction Network

Amy Hin Yan Tong, et al. *Science*, 2001.

EMAP is the Extension of SGA

- EMAP: Epistatic Miniarrray Profiles (Maya Schuldiner, et al. 2005. *Cell*)
- Quantitative measurement of phenotype (colony size)
 - Measure both positive and negative interactions.
 - Genome-wide (DAMP for lethal genes).

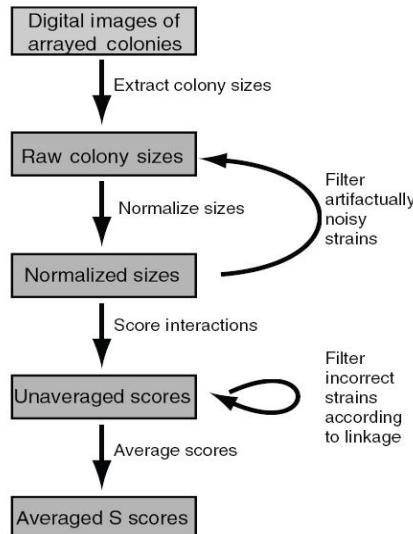

EMAP S-score

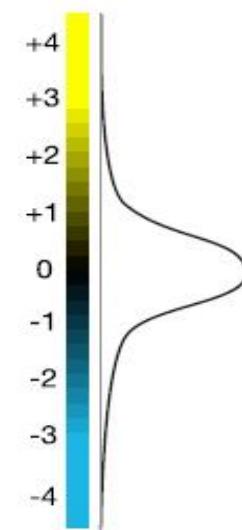

- Quantitative measure: $\epsilon = W_{ab} - W_a W_b$, $W_a = w/w_{wild}$.

No interaction	Synthetic sick/Lethality	Synthetic alleviating
$\epsilon = 0$	$\epsilon < 0$	$\epsilon > 0$

– T-Test with null hypothesis $\epsilon = 0$

$$S_0 = \frac{\mu_{ab} - w_a \mu_b}{\sqrt{n_1 S_{ab}^2 + n_2 w_a^2 S_b^2}}$$

high priority

Piwi

[Edit Wikipedia article](#)

Piwi (or PIWI) genes were identified as regulatory proteins responsible for stem cell and germ cell differentiation.^[4] Piwi is an abbreviation of *p*-element Induced *W*impy testis in Drosophila.^[5] Piwi proteins are highly conserved RNA-binding proteins and are present in both plants and animals.^[6] Piwi proteins belong to the Argonaute/Piwi family and have been classified as nuclear proteins. Studies on Drosophila have also indicated that Piwi proteins have slicer activity conferred by the presence of the Piwi domain.^[7] In addition, Piwi associates with Heterochromatin protein 1, an epigenetic modifier, and piRNA-complementary sequences. These are indications of the role Piwi plays in epigenetic regulation. Piwi proteins are also thought to control the biogenesis of piRNA as many Piwi-like proteins contain slicer activity which would allow Piwi proteins to process precursor piRNA into mature piRNA.

Protein structure and function

The structure of several Piwi and Argonaute proteins (Ago) have been solved. Piwi proteins are RNA-binding proteins with 2 or 3 domains: The N-terminal **PAZ domain** binds the 3'-end of the guide RNA; the middle **MID domain** binds the 5'-phosphate of RNA; and the C-terminal **PIWI domain** acts as an RNase H endonuclease that can cleave RNA.^{[8][9]} The small RNA partners of Ago proteins are microRNAs (miRNAs). Ago proteins utilize miRNAs to silence genes post-transcriptionally or use small-interfering RNAs (siRNAs) in both transcription and post-transcription silencing mechanisms. Piwi proteins interact with piRNAs (28–33 nucleotides) that are longer than miRNAs and siRNAs (~20 nucleotides), suggesting that their functions are distinct from those of Ago proteins.^[8]

Human Piwi proteins

Presently there are four known human Piwi proteins—PIWI-like protein 1, PIWI-like protein 2, PIWI-like protein 3 and PIWI-like protein 4. Human Piwi proteins all contain two RNA binding domains, PAZ and Piwi. The four PIWI-like proteins have a spacious binding site within the PAZ domain which allows them to bind the bulky 2'-OCH₃ at the 3' end of piwi-interacting RNA.^[10]

One of the major human homologues, whose upregulation is implicated in the formation of tumours such as seminomas, is called hiwi (for human in wi).^[11]

Homologous proteins in mice have been called miwi (for mouse in wi).^[12]

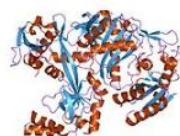

Role in germline cells

PIWI proteins play a crucial role in fertility and germline development across animals and ciliates. Recently identified as a polar granule component, PIWI proteins appear to control germ cell formation so much so that in the absence of PIWI proteins there is a significant decrease in germ cell formation. Similar observations were made with the mouse homologs of PIWI, MILI, MIWI and MIWI2. These homologs are known to be present in spermatogenesis. Miwi is expressed in various stages of spermatocyte formation and spermatid elongation where Miwi2 is expressed in Sertoli cells. Mice deficient in either Mili or Miwi-2 have experienced spermatogenic stem cell arrest and those lacking Miwi-2 underwent a degradation of spermatogonia.^[13] The effects of piwi proteins in human and mouse germlines seems to stem from their involvement in translation control as Piwi and the small noncoding RNA, piwi-interacting RNA (piRNA), have been known to co-fractionate polysomes. The piwi-piRNA pathway also induces heterochromatin formation at centromeres,^[14] thus affecting transcription. The piwi-piRNA pathway also appears to protect the genome. First observed in Drosophila, mutant piwi-piRNA pathways led to a direct increase in dsDNA breaks in ovarian germ cells. The role of the piwi-piRNA pathway in transposon silencing may be responsible for the reduction in dsDNA breaks in germ cells.

Role in RNA interference

The piwi domain^[15] is a protein domain found in piwi proteins and a large number of related nucleic acid-binding proteins, especially those that bind and cleave RNA. The function of the domain is double stranded-RNA-guided hydrolysis of single stranded-RNA that has been determined in the argonaute family of related proteins.^[1] Argonautes, the most well-studied family of nucleic-acid binding proteins, are RNase H-like enzymes that carry out the catalytic functions of the RNA-induced silencing complex (RISC). In the well-known cellular process of RNA interference, the argonaute protein in the RISC complex can bind both small interfering RNA (siRNA) generated from exogenous double-stranded RNA and microRNA (miRNA)

Piwi domain

The piwi domain of an argonaute protein with bound siRNA, components of the RNA-induced silencing complex that mediates gene silencing by RNA interference.

Key: █ PAZ domain █ Piwi domain

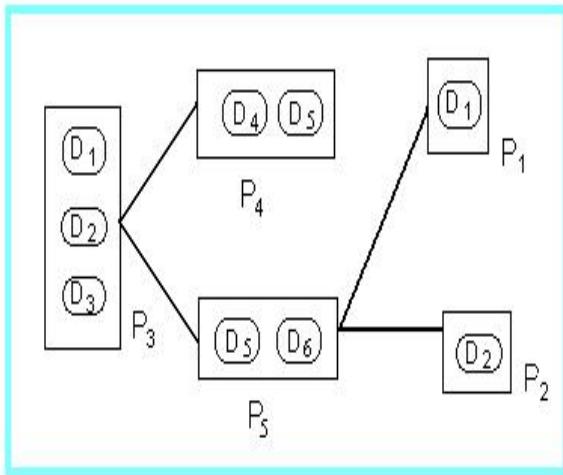

All human Piwi proteins and argonaute proteins have the same RNA binding domains, PAZ and Piwi.^[2]

Association-A simple method

$$V(D_{ij}) = \frac{\#\{\text{Interacted protein pairs contain } D_{ij}\}}{\#\{\text{All protein pairs contain } D_{ij}\}}$$

More observed PPIs for one domain pair will give higher probability of interaction for that domain pair.

Simple Example

By association method:

$$D_{34} = D_{35} = D_{36} = D_{26} = D_{16} = 1.0$$

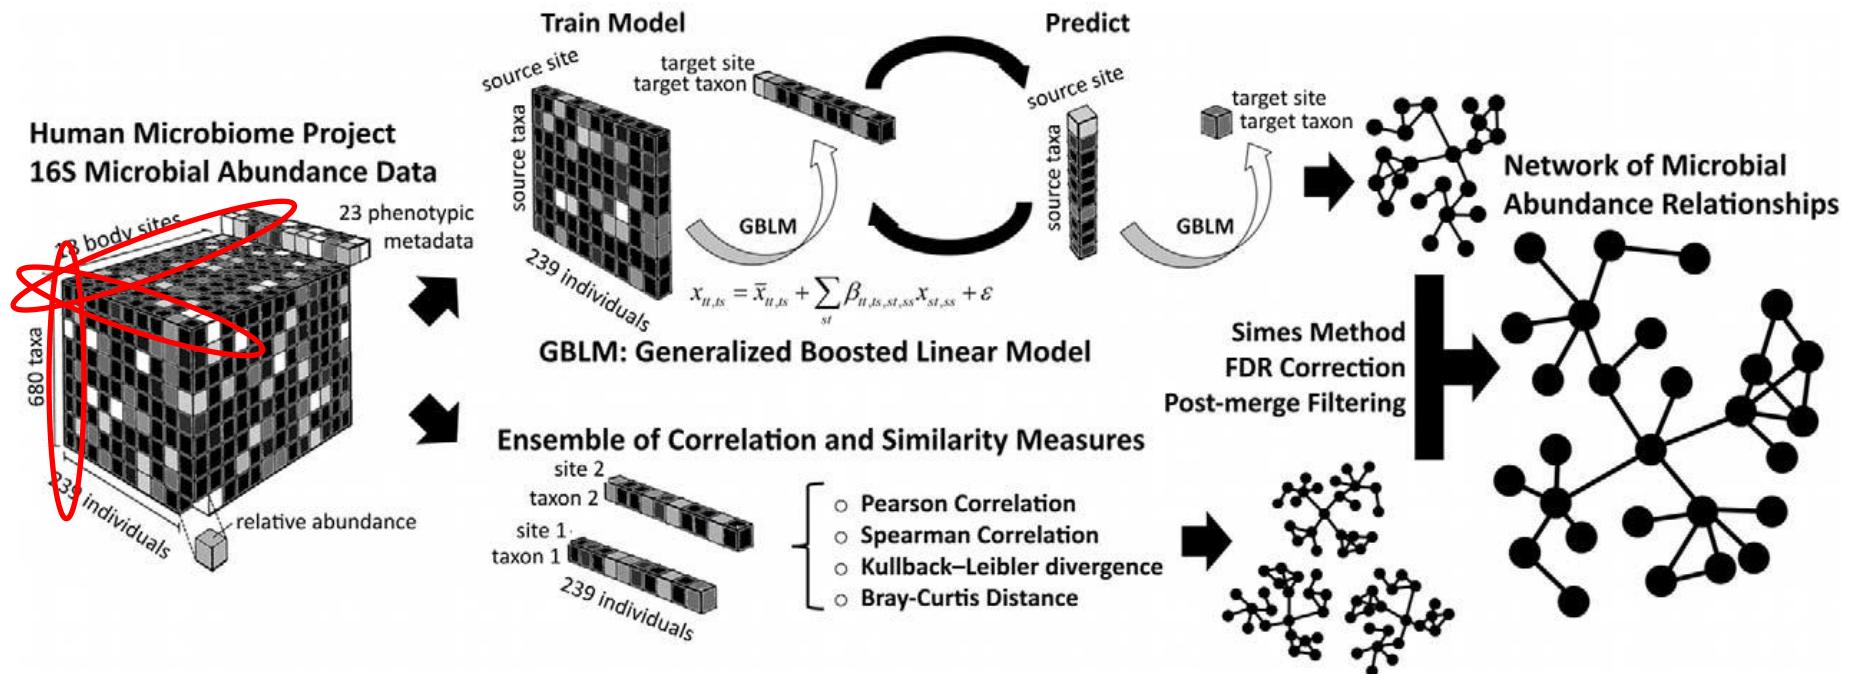

$$D_{15} = D_{25} = 0.75, D_{14} = D_{24} = 0.5$$

Others are 0.0.

$$D_{15}: \{P_{34}, P_{35}, P_{15}\}/\{P_{34}, P_{35}, P_{15}, P_{14}\} = 0.75$$

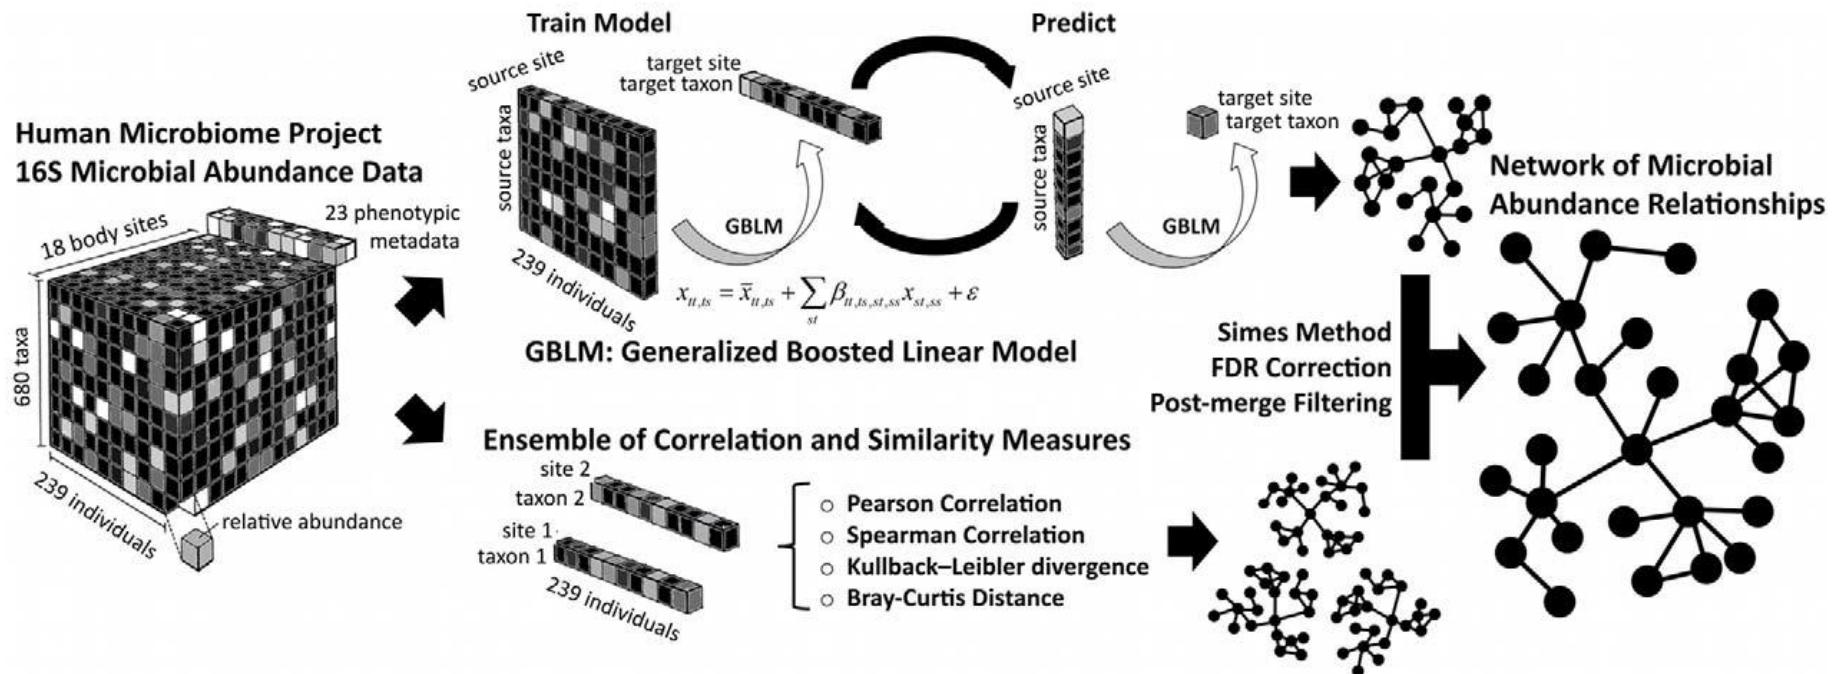

More complicated example

Generalized Boosted Linear Models (GBLM): 广义线性模型

$$x_{tt,ts} = \bar{x}_{tt,ts} + \sum_{st} \beta_{tt,ts,st,ss} x_{st,ss}$$

$$\text{logit}(x_{tt,ts}) = \bar{x}_{tt,ts} + \sum_{st} \beta_{tt,ts,st,ss} x_{st,ss}$$

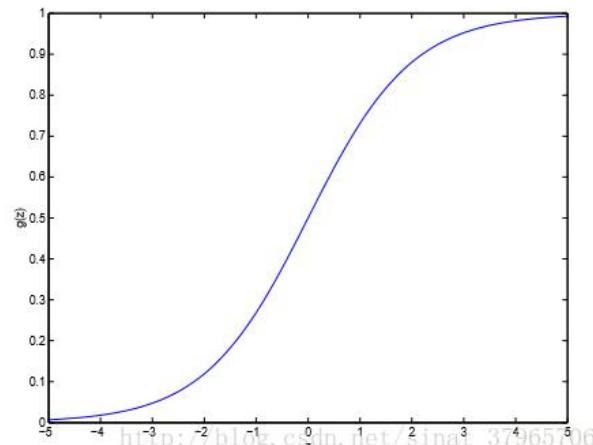

Huttenhower, et al., *PLoS Computational Biology*, 2013

More complicated example

Generalized Linear Models (GLM): 广义线性模型

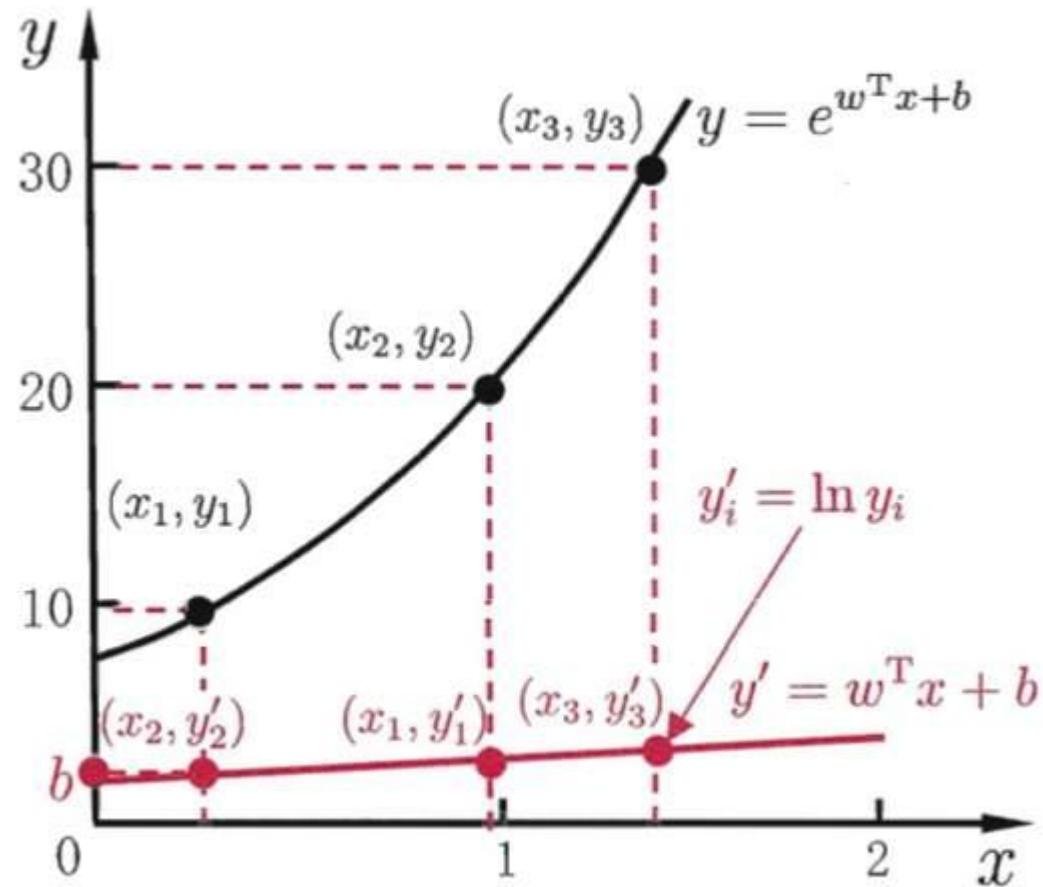

广义线性模型的核心体现在：

- y 服从指数族分布(包括高斯分布，伯努利分布，多项式分布，泊松分布， beta 分布.....)，且同个样本的 y 必须服从同个分布
- 接着在具体分布中比较与指数分布族之间的参数关系，最重要的就是具体分布的参数(Φ)和指数分布参数(η)之间的关系

More complicated example

Generalized Linear Models (GLM): 广义线性模型

Limitation of Association Method

- For multiple-domain proteins, this method computes the value for a certain domain pair ignoring the value of other domain-domain pairs. So it's a local one.
- This method cannot deal with possible error of the data.

Probabilistic Model

- Domain-domain interactions are independent, which means that the event that two domains interact or not does not depend on other domains.
- Two proteins interact if and only if at least one pair of domains from the two proteins interact.

Yeast Data

- Interactions (Uetz's and Ito's interaction data).
- Domain: Pfam (Pfam-A, Pfam-B).
- Proteins: SGD, N=6359.

Protein Interaction Data Sources

	Proteins	Pfam domains	Super - domains	PPI
Uetz	1337	1330	313	1445
Ito	3277	2776	909	4475
Uetz+Ito	3729	3124	1007	5719
Overlap	855	964	215	201

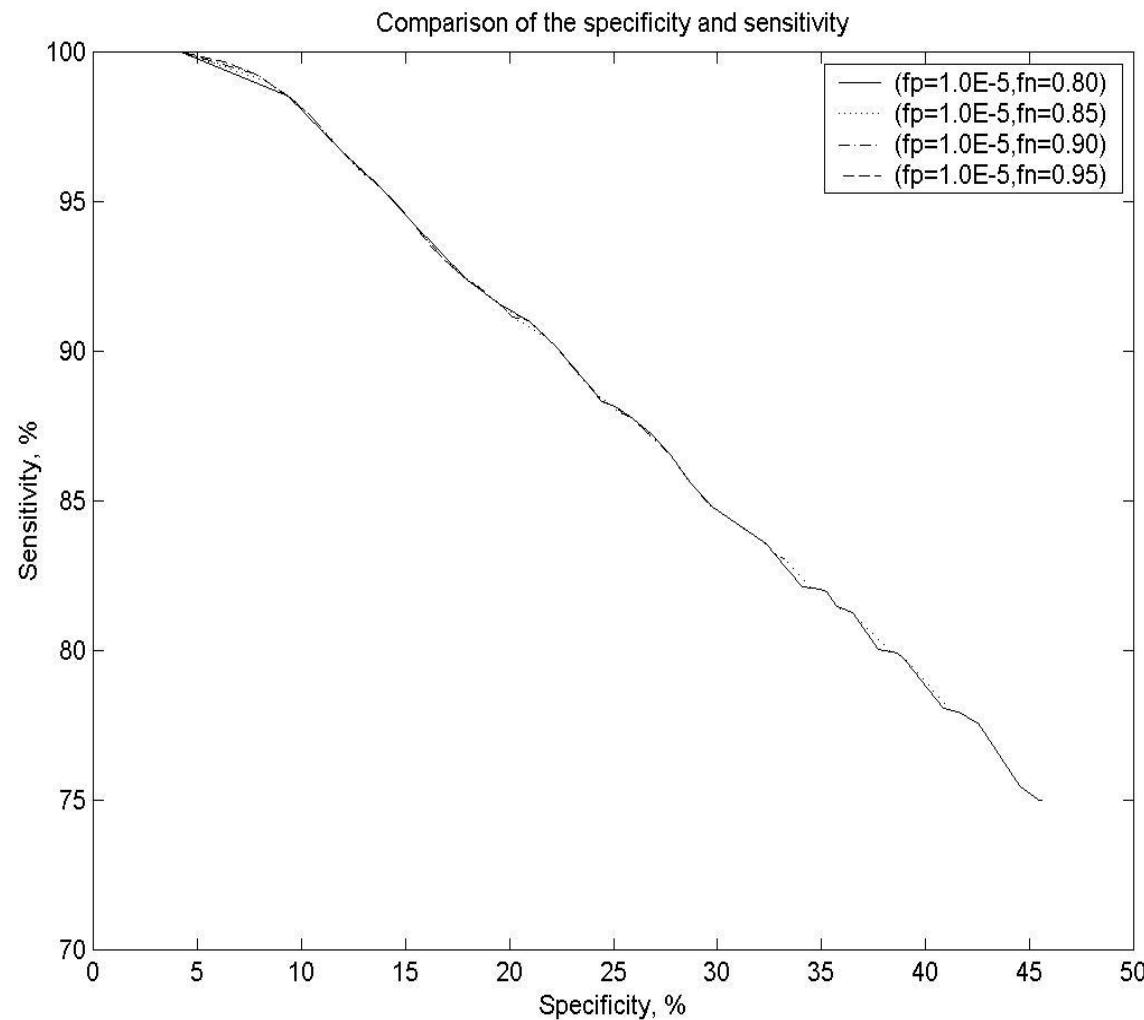

Measure the Accuracy

- Specificity and sensitivity.
- Verification by MIPS physical interactions (as TRUE interactions).
- Relationship between protein-protein interactions and expression data.

$$SP = \frac{\text{number of matches with observation}}{\text{number of prediction}}$$

$$SN = \frac{\text{number of match with observation}}{\text{number of observation}}$$

Verification by Known PPIs

- MIPS physical interaction. (Totally 2570 PPIs, 1414 PPIs not overlapping with our training set).
- Compare with random matching.
 - Fold number
 - Larger fold number imply more reliable prediction

$$\# \text{Fold} = \frac{\#\{\text{Our prediction matched to MIPS}\}}{\#\{\text{Expectation of random pairs matched to MIPS}\}}$$

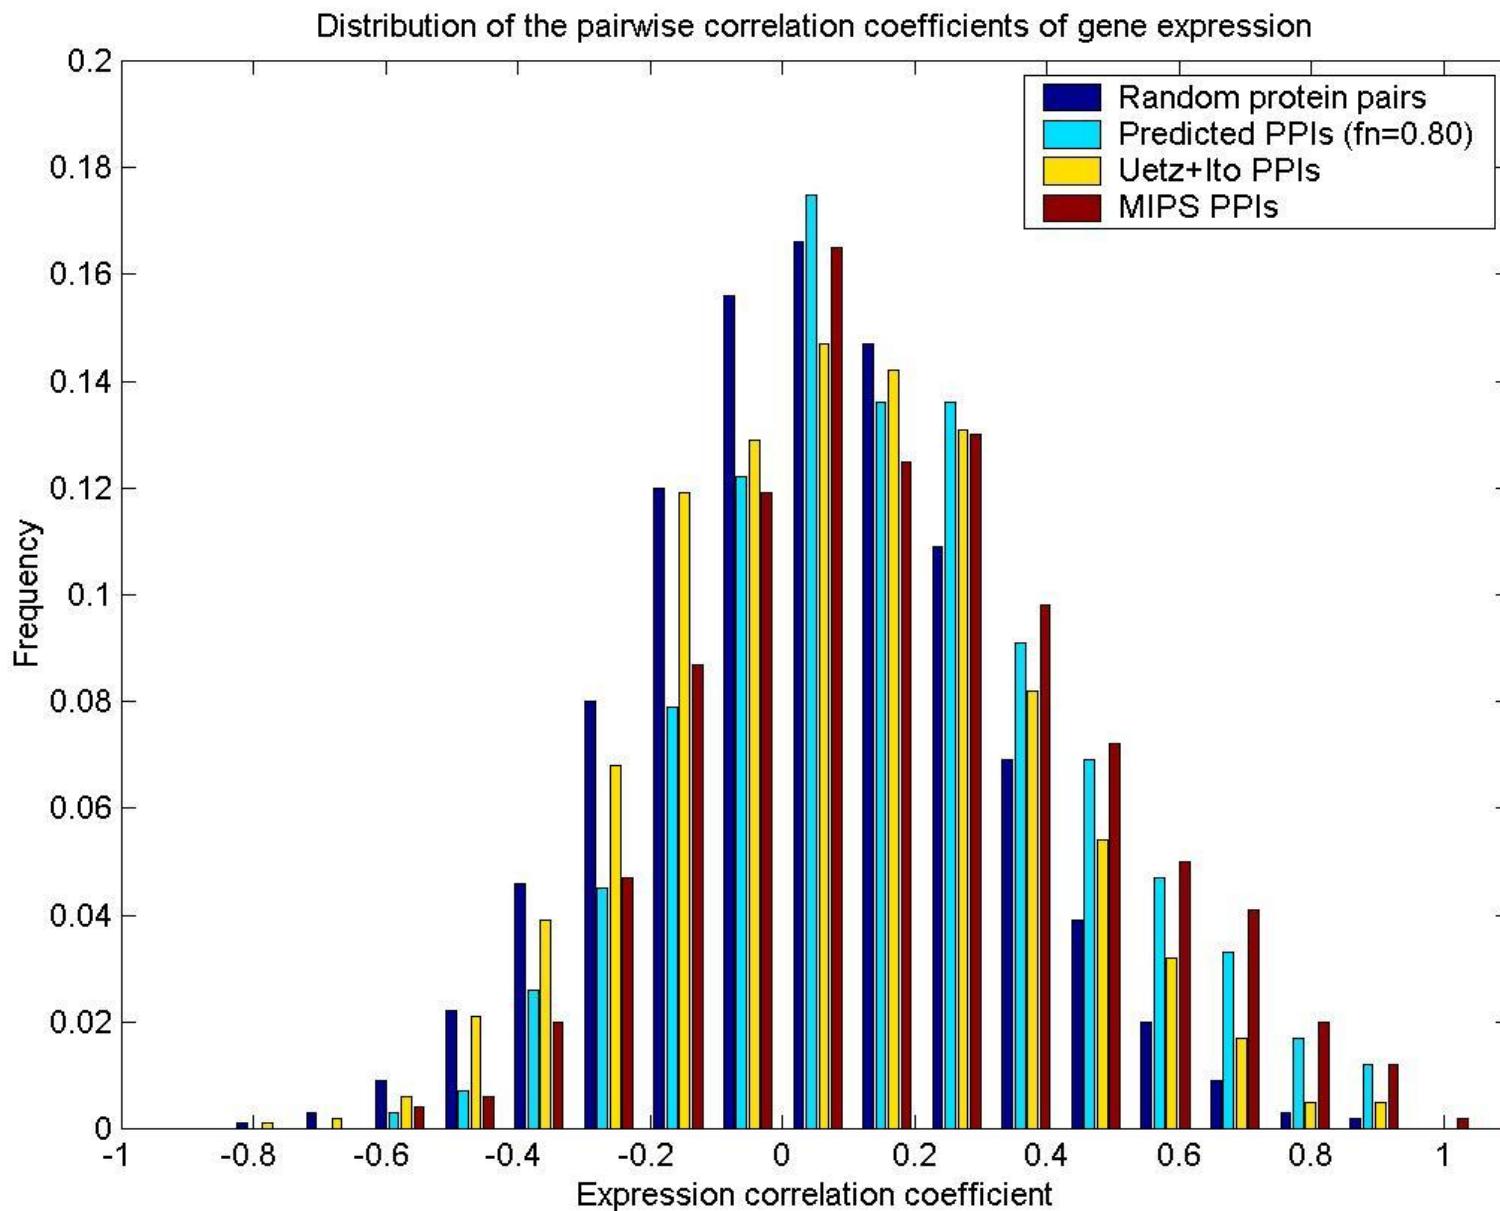

Think about FDR again...

第8-3章： Network Module

- Definition
- Module detection
- Bayesian approach
- Markov clustering algorithm

Network Modular

Modularity

- Suppose we are given a candidate division of the vertices into some number of groups. The modularity of this division is defined to be the fraction of the edges that fall within the given groups minus the expected such fraction if edges were distributed at random.

[http://en.wikipedia.org/wiki/Modularity_\(networks\)](http://en.wikipedia.org/wiki/Modularity_(networks))

Modularity

- A_{ij} : adjacency matrix
- k_i : degree
- m : total number of edges

$$Q = \frac{1}{2m} \sum_{ij} (A_{ij} - \frac{k_i k_j}{2m}) \delta(c_i, c_j)$$

Modularity

- For two class problem, let $s_i=1$ if node i belongs to group 1 and $s_i=-1$ if it belongs to group 2,

$$\delta(c_i, c_j) = \frac{1}{2}(s_i s_j + 1)$$

$$Q = \frac{1}{4m} \sum_{ij} S^T B S$$

$$B = (B_{ij}), B_{ij} = A_{ij} - \frac{k_i k_j}{2m}$$

$$S = (s_1, \dots, s_n)^T$$

Example

$$A = \begin{pmatrix} 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 & 0 \end{pmatrix} \quad m = 4, k_1 = k_2 = 1 \\ k_3 = k_4 = k_5 = 2$$

\downarrow

$$B = \frac{1}{8} \begin{pmatrix} -1 & 7 & -2 & -2 & -2 \\ 7 & -1 & -2 & -2 & -2 \\ -2 & -2 & -4 & 4 & 4 \\ -2 & -2 & 4 & -4 & 4 \\ -2 & -2 & 4 & 4 & -4 \end{pmatrix}$$

```
graph LR; 1 --- 2; 4 --- 3; 4 --- 5;
```

Spectrum Method

- The largest eigenvectors will give the best grouping, positive entries corresponding to one class, and negative ones corresponding to another class.
- This can be achieved by power method

$$\lim_{k \rightarrow +\infty} \frac{A^k e}{e^T A^k e} = w$$

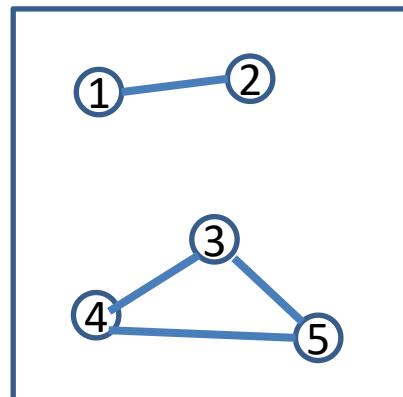

where $e = (1, 1, \dots, 1)^T$

Example

- 对于上述矩阵B, 可以计算出最大特征值为10, 对应的特征向量

$$v = (-0.55, -0.55, 0.37, 0.37, 0.37)$$

- 于是我们对节点的划分为{1,2}; {3,4,5}

优化方法

- 既然现在有一个衡量划分“好坏”的量 Q , 那么一般的优化方法都可以使用;
 - 1. 给定初始划分
 - 2. 对于划分的某种修正, 计算 Q 的改变量
 - 3. 依据一定的原则考虑是否接受这种修正, 重复步骤2, 直到某种收敛条件满足。
- Greedy方法
- 模拟退火方法

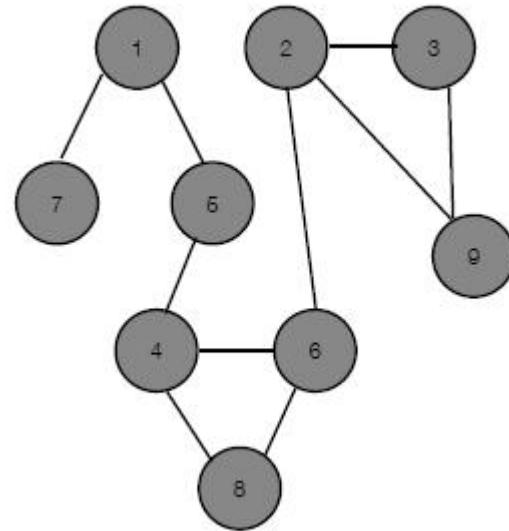

A Bayesian Approach to Network Modularity

Slides for this part are mainly from
Hofman's talk

www.jakehofman.com/talks/apam_20071019.pdf

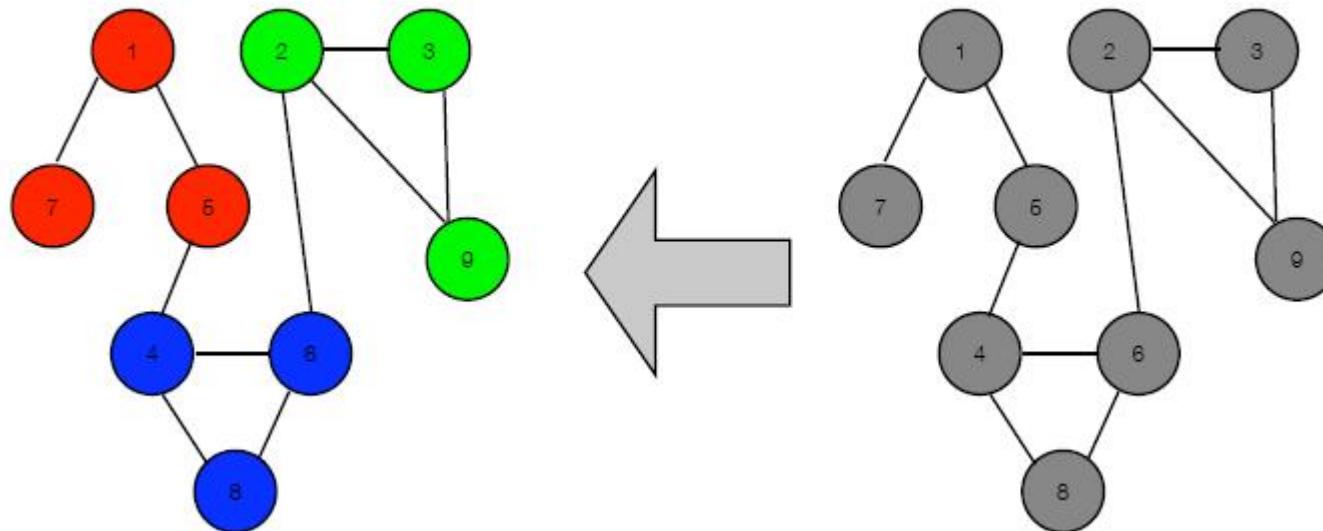

Overview: Modular Networks

- Given a network
 - Assign nodes to modules?
 - Determine number of modules(scale/complexity)?

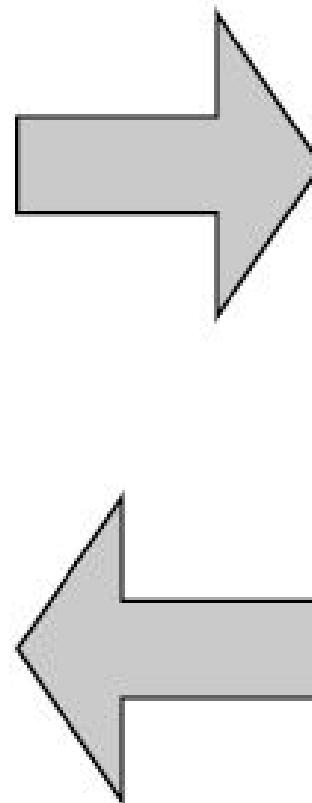

Overview: Modular Networks

- With a generative model of modular networks, rules of probability tell us how to calculate model parameters (e.g. number of modules & assignments)

Generative Models

Know model

data

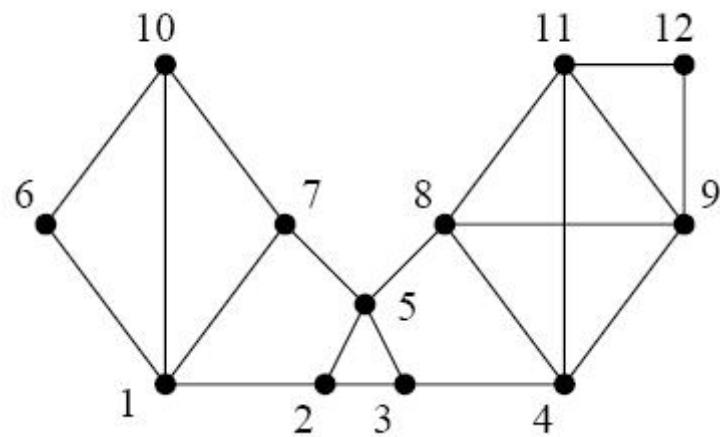

Markov Clustering Algorithm

van Dongen. A cluster algorithm for
graphs. Information Systems, 2000

K-length Path

- Basic idea: dense regions in sparse graphs corresponding with regions in which the number of k-length path is relatively large.
- Random walks can also be used to detect clusters in graphs, the idea is that the more closed is a subgraph, the largest the time a random walker need to escape from it.

K-path Clustering

5	2	1	0	2	3	3	0	0	4	0	0
2	4	3	1	3	1	2	1	0	1	0	0
1	3	4	2	3	0	1	2	1	0	1	0
0	1	2	5	2	0	0	4	4	0	4	2
2	3	3	2	5	0	2	2	1	1	1	0
3	1	0	0	0	3	2	0	0	3	0	0
3	2	1	0	2	2	4	1	0	3	0	0
0	1	2	4	2	0	1	5	4	0	4	2
0	0	1	4	1	0	0	4	5	0	5	3
4	1	0	0	1	3	3	0	0	4	0	0
0	0	1	4	1	0	0	4	5	0	5	3
0	0	0	2	0	0	0	2	3	0	3	3

Matrix manipulation: $(N+I)^2$

Markov Clustering

- Expansion: Through matrix manipulation (power), one obtains a matrix for a n-steps connection.
- Inflation: Enhance intercluster passages by raising the elements to a certain power and then normalize

Markov Clustering Algorithm

- Iteratively running two operators

- Inflation:

$$(T_r M)_{ij} = \frac{M_{ij}^r}{\sum_i M_{ij}^r} \quad \text{Column normalization}$$

- Expansion:

$$\text{Expand}(M) = M^k$$

大数据问题

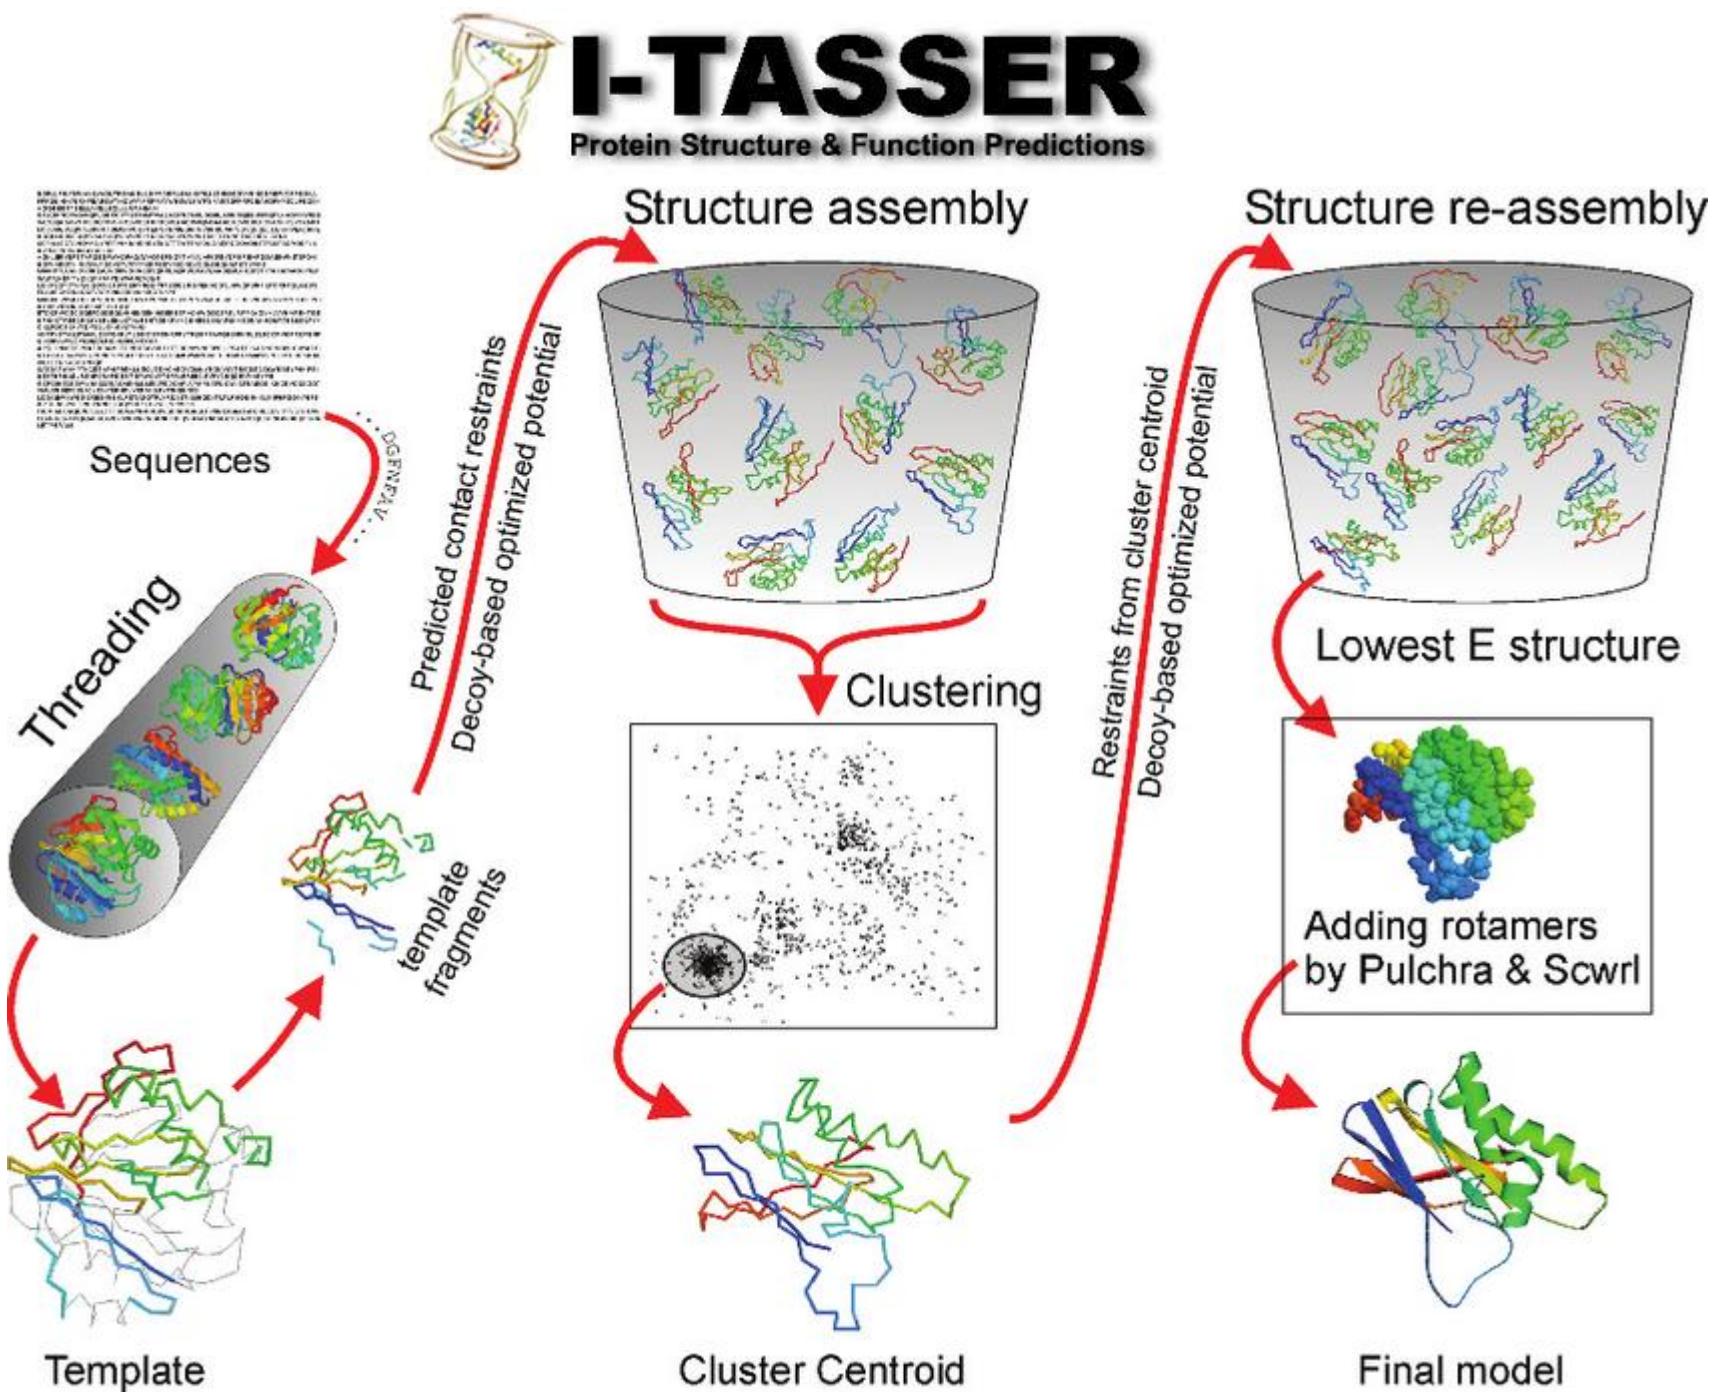

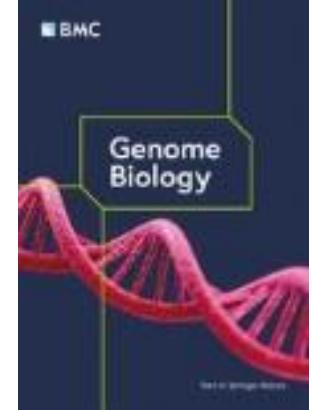

The hub for Rosetta modeling software

Top: Researchers gathering samples from Great Boiling Spring in Nevada. Left: a snapshot of aligned metagenomic sequences. Each row is a different sequence (the different colors are the different amino acid groups). Each position (or column) is compared to all other positions to detect patterns of co-evolution. Bottom: the strength of the top co-evolving residues is shown as blue dots, these are also shown as colored lines on the structure above. The goal is to make a structure that makes as many of these contacts as possible. Right: a cartoon of the protein structure predicted. The protein domain shown is from Pfam DUF3794, this domain is part of a Spore coat assembly protein SafA. (Image of Great Boiling Spring by Brian Hedlund, UNLV. Protein structure and composite image by Sergey Ovchinnikov, UW)

在2020的CASP中，AlphaFold系统对所有蛋白靶点3D结构预测的中位GDT评分为92.4分。即便是针对最难解析的蛋白靶点，AlphaFold的中位GDT评分也达到了87.0分。在接受检验的近100个蛋白靶点中，AlphaFold对三分之二的蛋白靶点给出的预测结构与实验手段获得的结构相差无几。CASP创始人Moult教授表示，在有些情况下，已经无法区分两者之间的区别是由于AlphaFold的预测出现错误，还是实验手段产生的假象。

CASP14

(Critical Assessment of Techniques for Protein Structure Prediction)

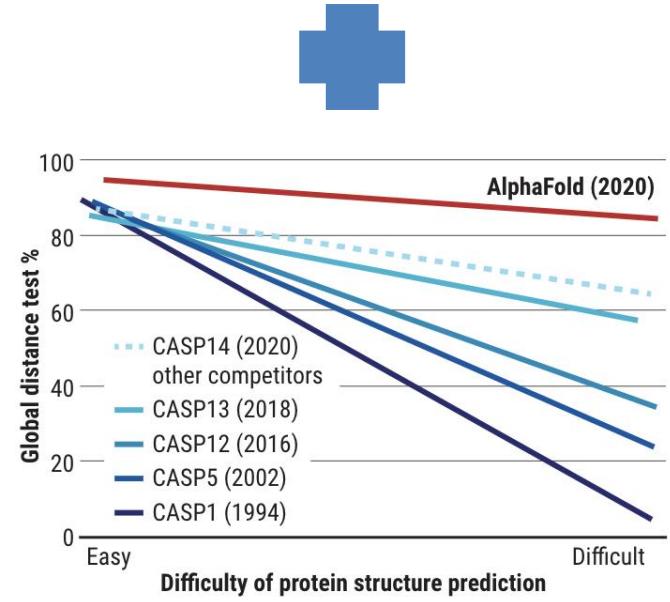

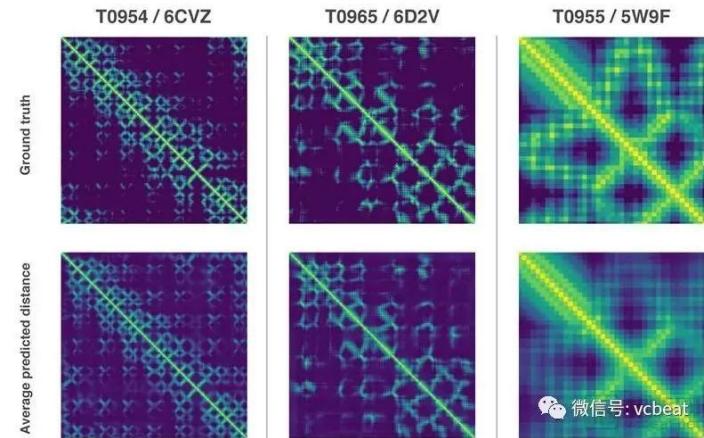

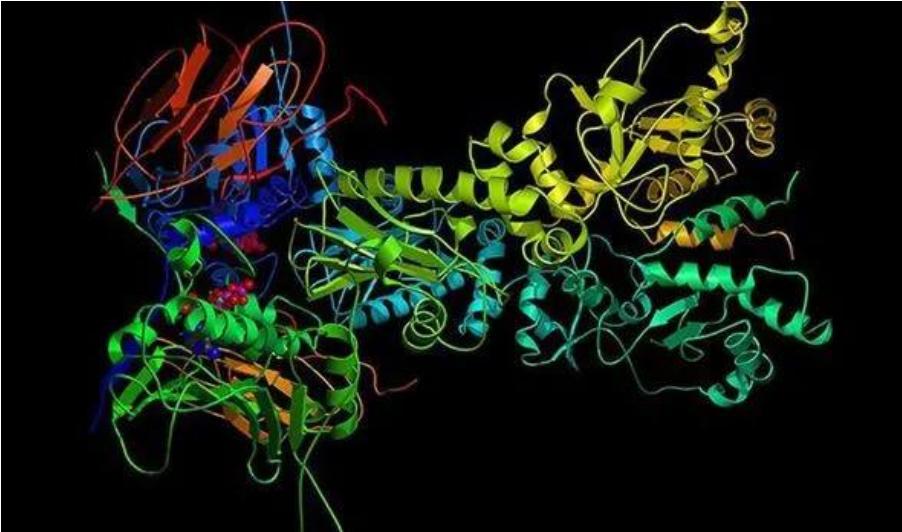

- 我们可以把蛋白质折叠看作一个「空间图」，节点表示残基（residue），边则将残基紧密连接起来。这个空间图对于理解蛋白质内部的物理交互及其演化史至关重要。对于在 CASP14 比赛中使用的最新版 AlphaFold，DeepMind 团队创建了一个基于注意力的神经网络系统，并用端到端的方式进行训练，以理解图结构，同时基于其构建的隐式图执行推理。该方法使用进化相关序列、多序列比对（MSA）和氨基酸残基对的表示来细化该图。
- DeepMind 团队在公开数据上训练这一系统，这些数据来自蛋白质结构数据库（PDB）和包含未知结构蛋白质序列的大型数据库，共包括约 170,000 个蛋白质结构。该系统使用约 128 个 TPUv3 内核（相当于 100-200 个 GPU）运行数周，与现今机器学习领域出现的大型 SOTA 模型相比，该系统所用算力相对较少。
- AlphaFold 还具备很多令人兴奋的技术潜力：探索数亿个目前还没有模型的数亿蛋白质，以及未知生物的广阔领域。由于 DNA 指定了构成蛋白质结构的氨基酸序列，基因组学革命使大规模阅读自然界的蛋白质序列成为可能——在通用蛋白质数据库（UniProt）中有 1.8 亿个蛋白质序列。相比之下，考虑到从序列到结构所需的实验工作，蛋白质数据库（PDB）中只有大约 170000 个蛋白质结构。在未确定的蛋白质中可能有一些新的和未确定的功能——就像望远镜帮助人类更深入的观察未知宇宙一样，像 AlphaFold 这样的技术可以帮助找到未确定的蛋白质结构。

CASP14

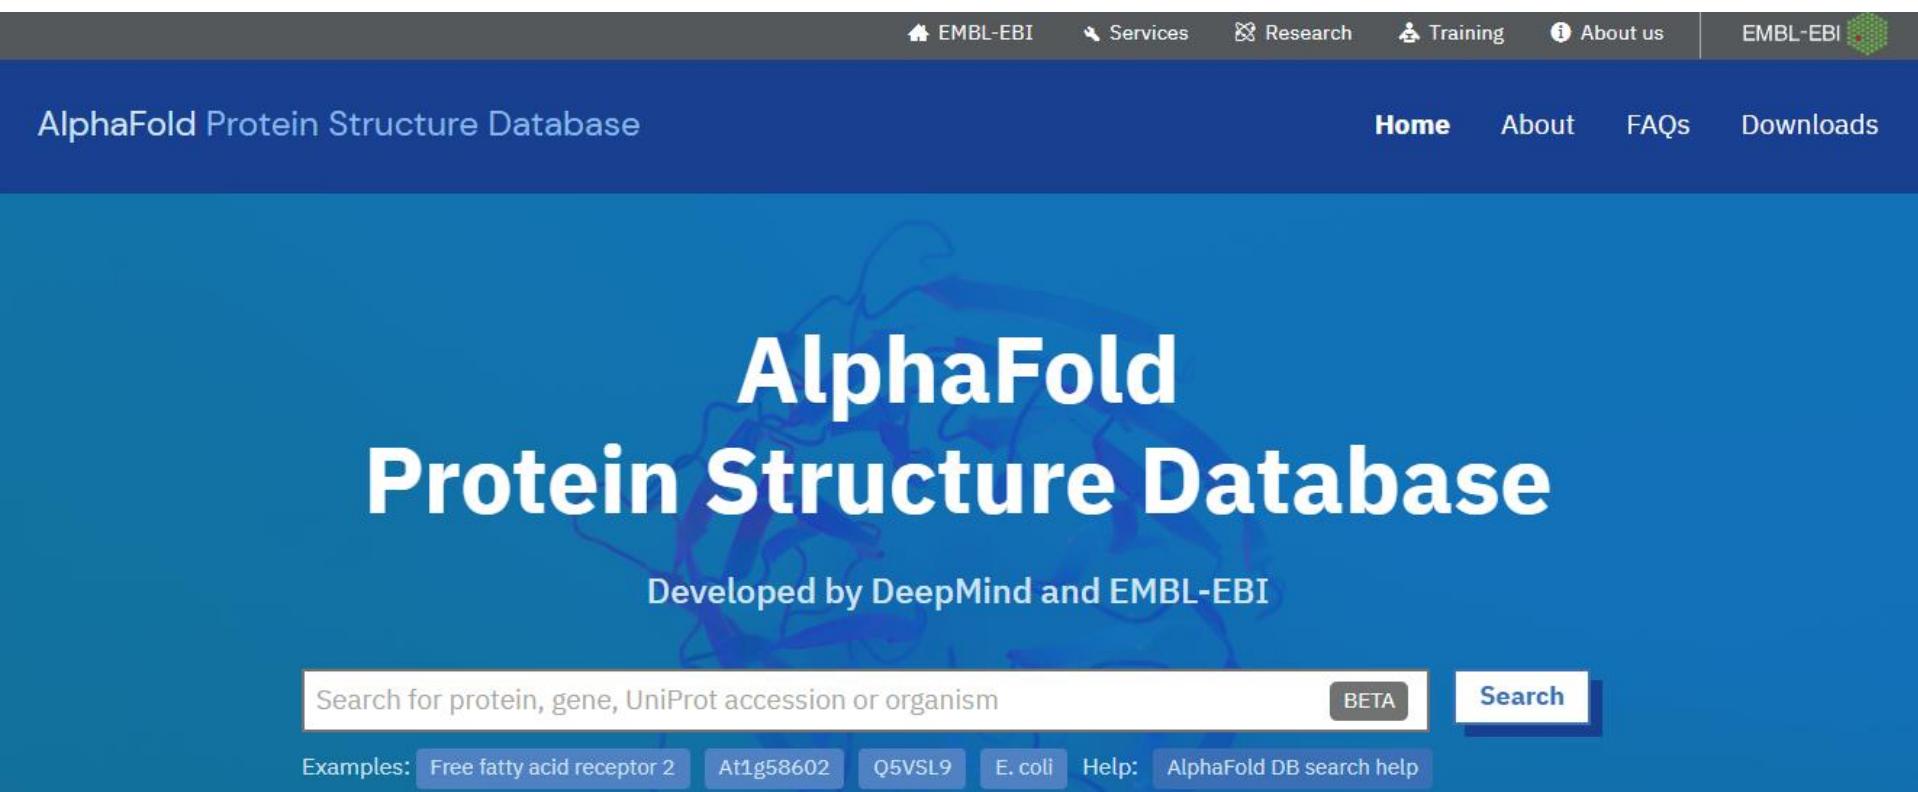

(Critical Assessment of Techniques for Protein Structure Prediction)

- 在今年早些时候，DeepMind已经利用这一系统预测了多种新冠病毒蛋白的结构。后续的实验显示，AlphaFold预测的新冠病毒Orf3a蛋白结构与冷冻电镜解析的结构非常相似。
- 虽然，AlphaFold不见得会取代冷冻电子显微镜等其它实验手段，但是DeepMind的研究人员表示，这一令人兴奋的结果表明，生物学家们可以使用计算结构预测作为科学研究的核心工具之一。这一手段对于特定类型的蛋白来说可能尤为便利，例如膜蛋白一直非常难于结晶，因此很难用实验手段获得它们的结构。
- 而对于从事计算和机器学习研究的DeepMind团队来说，AlphaFold的表现证明了AI在辅助基础科学发现方面惊人的潜力。该团队在公司发布的博文中表示，他们相信，AI将成为人类拓展科学知识前沿最有力的工具之一！

Protein design by AI

HOW TO DESIGN A PROTEIN

Researchers have developed dozens of artificial-intelligence (AI) protein-design tools in recent years, using several approaches. Here are four techniques that design new protein structures or sequences using AI. In practice, researchers can mix and match methods to come up with a working final design.

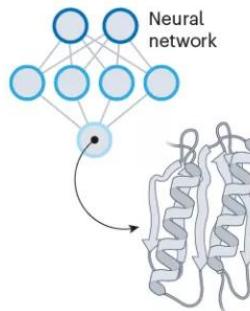

Fixed-backbone design

Given a predetermined protein structure, an AI network determines an amino-acid sequence for that protein.

Structure generation

A neural network trained on protein structures can generate totally novel protein structures, but often with limited control of the output.

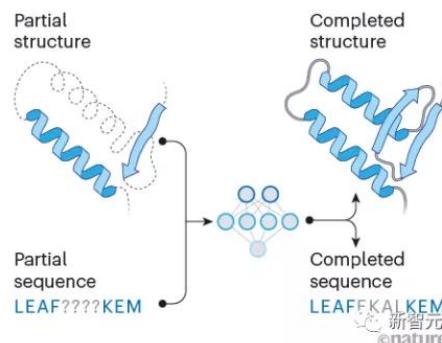

Sequence generation

Using language models, a neural network learns to 'speak' protein. These networks can be fine-tuned to generate novel sequences resembling members of specific protein families.

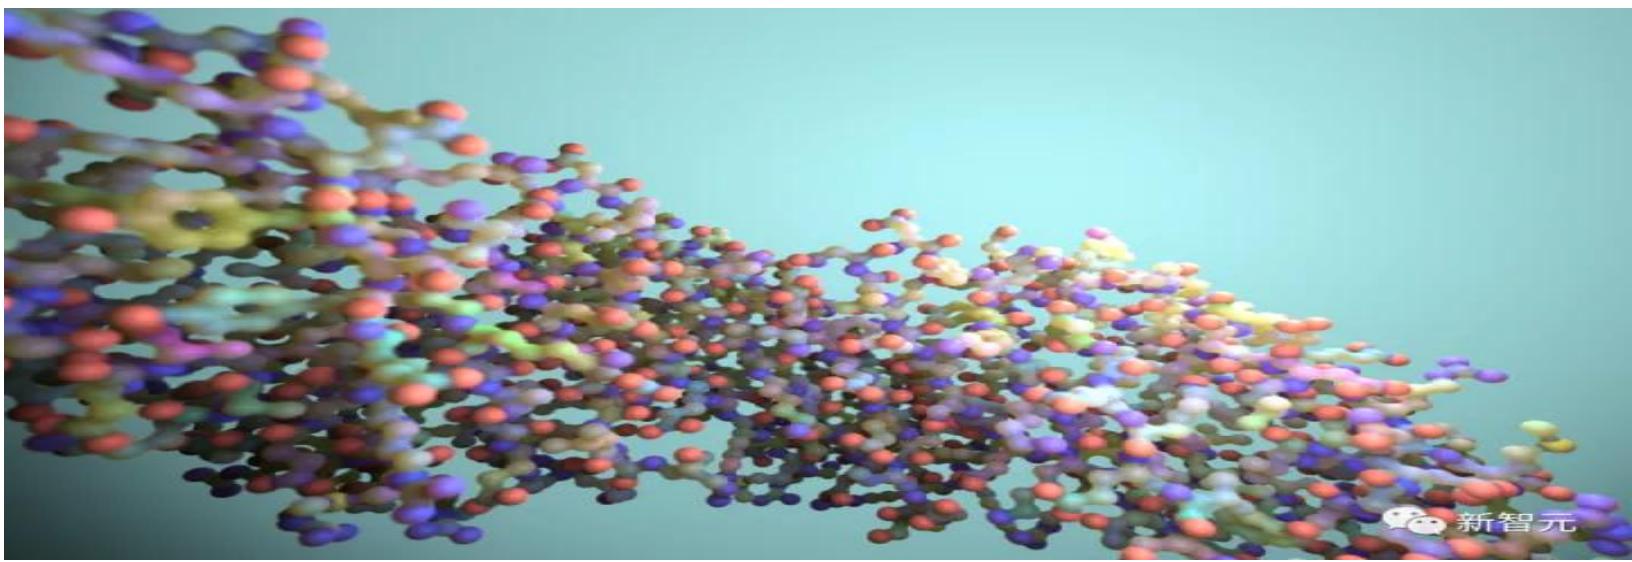

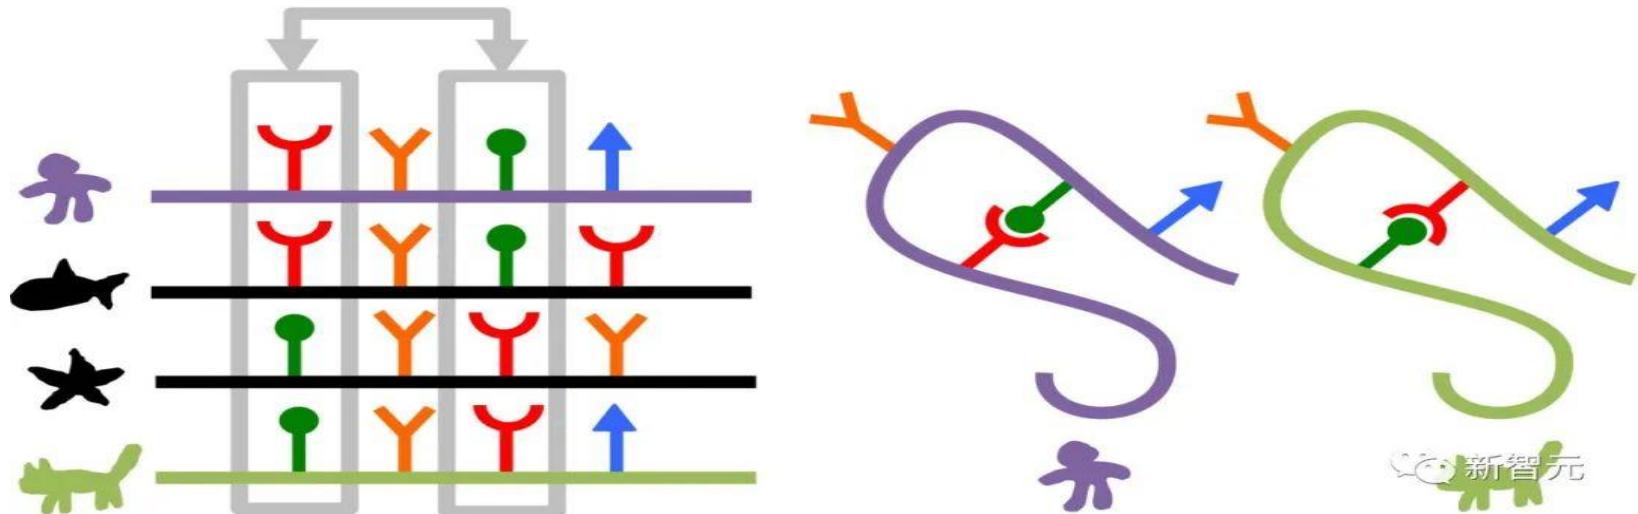

Sequence and structure design

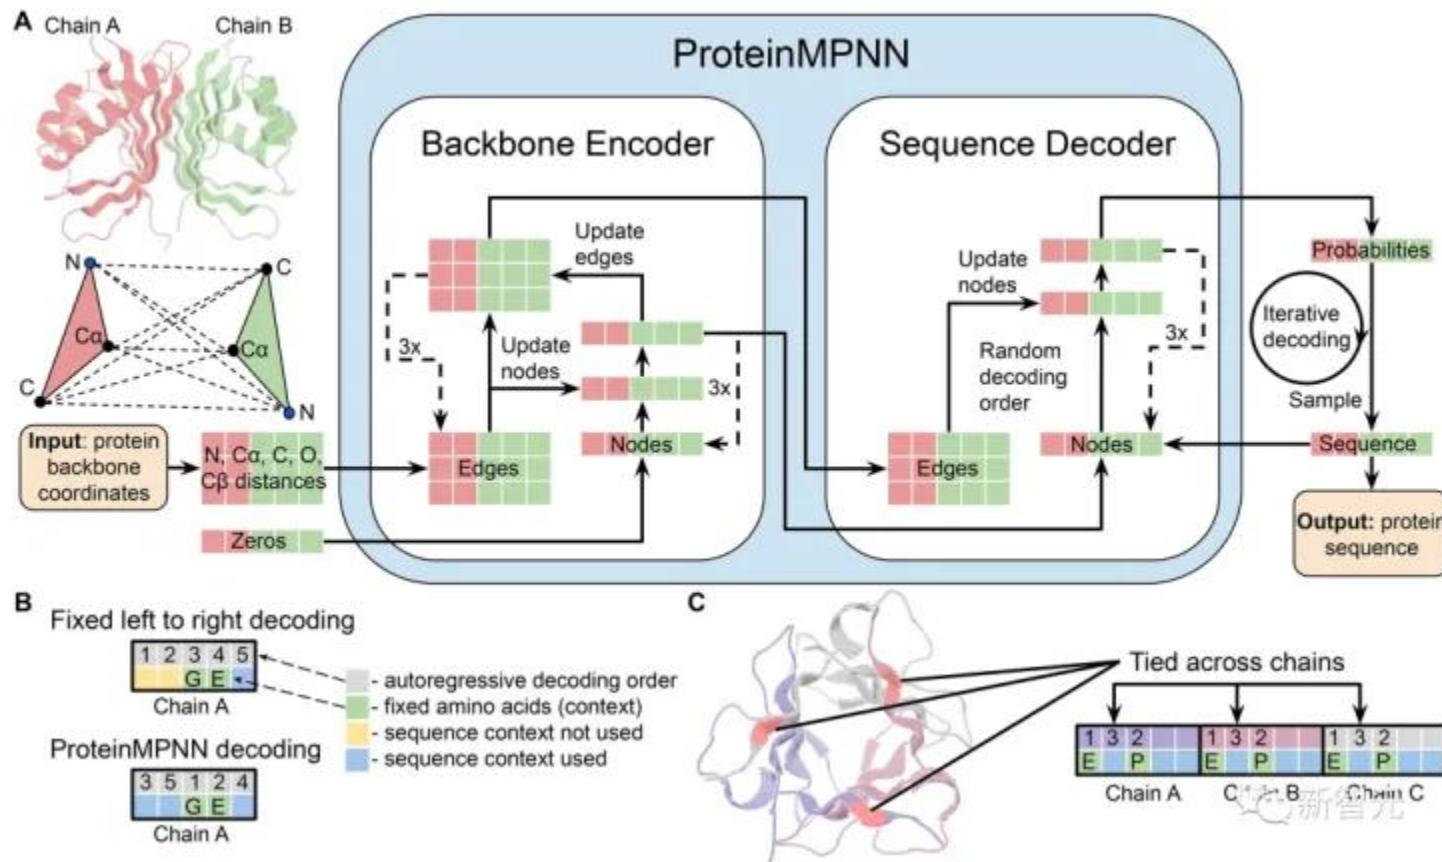

Using one approach called inpainting, researchers input a structure or sequence that they want included in a protein, and the AI network fills in the rest.
